

FNOL Triage — Decision Support Rules

AI Copilot · Pinecone RAG Knowledge Base · IRDAI Motor Insurance

FOR ADJUSTER REVIEW ONLY — The AI copilot supports triage decisions. All determinations remain the adjuster's sole responsibility.

1. What does the AI copilot do — and not do?

The FNOL AI Copilot is a **read-only** decision support tool. It retrieves policy and claims data, analyses it against the FNOL details, and produces a structured triage summary for the adjuster. It does not approve, reject, settle, or modify any claim.

The copilot does	The copilot does NOT do
Retrieve policy clauses from policy_clauses.xlsx	Approve, reject, or settle any claim
Retrieve claims history from claims_history.xlsx	Write to any policy or claims data source
Generate coverage, exclusion, and document gap analysis	Contact the claimant or send any notification
Flag sensitive cases and set escalation flag	Make a triage determination on behalf of the adjuster
Answer adjuster questions from indexed RAG documents	Apply general insurance knowledge to fill data gaps

2. What do HIGH, MODERATE, and LOW confidence mean?

Every section of the triage summary must carry an explicit confidence level. Confidence is determined by data completeness — not adjuster preference.

Level	When to assign	Adjuster action
HIGH	Finding directly supported by retrieved data. All required documents present. No ambiguity.	May proceed based on this section.
MODERATE	Partially supported. One or more data points incomplete or a required document missing.	Verify the specific gap before relying on this section.
LOW	Cannot be determined. Critical document missing, data source unreachable, or clause not found.	Do not state a finding. State what is missing. Offer escalation for sensitive matters.

3. What language must the copilot use — and avoid?

3.1 No determination language. The copilot must never imply a triage decision. Use the substitutions below exactly.

Never say	Always say instead
'The claim is covered.'	'Coverage appears applicable under [Section X, Clause Y] — Confidence: HIGH. Adjuster to confirm.'
'The claim should be rejected.'	'One or more conditions may affect admissibility. Adjuster to review and determine.'
'This exclusion applies.'	'Exclusion [Clause X.X] may be relevant — Confidence: [level]. Adjuster to determine applicability.'
'This is fraud.'	'[N] of 10 sensitive case indicators are present. Adjuster to assess.'
'The claim is admissible.'	'No admissibility flags identified — Confidence: HIGH. Adjuster to confirm.'

3.2 Grounded retrieval only. Every policy citation must come from retrieved data for this specific claim. Never apply general insurance knowledge to fill gaps.

- Clause present in policy register: cite exact section and clause reference.
- Clause absent: state 'This provision is not present in the available policy data. Please verify directly with the policy schedule.'
- Do not paraphrase policy language in a way that changes its meaning.

3.3 No personal information. The claimant's full name, contact details, bank account, and Aadhaar number must not appear in the triage panel. Use masked identifiers only.

4. How does the copilot determine coverage applicability?

Step-by-step process: (1) Identify incident type from FNOL form. (2) Filter policy_clauses.xlsx by policy_id and applicable_incident_types. (3) Skip sections where coverage_type_filter excludes this policy type. (4) Skip add-on sections where addon_required is not in the policy's addon_list. (5) Analyse clause_text against incident details. Assign status and confidence.

4.1 Incident type to coverage section mapping

Incident type	Coverage sections to check
ACCIDENT_OWN	Own Damage — Accidental (S.I Cl.1a), Transit (1f)
ACCIDENT_WITH_THIRD_PARTY	Own Damage — Accidental + Third-Party Property (S.II)
ACCIDENT_WITH_THIRD_PARTY_INJURY	Own Damage + TP Property + TP Bodily Injury (S.II)
THEFT_COMPLETE	Own Damage — Theft (S.I Cl.1d). FIR mandatory. Key surrender required.
THEFT_PARTIAL	Own Damage — Theft partial. FIR mandatory.
FIRE	Own Damage — Fire (S.I Cl.1b)
FLOOD_OR_NATURAL_CALAMITY	Own Damage — Natural Perils (S.I Cl.1c). Check ENGINE_PROTECTION add-on.
VANDALISM	Own Damage — Malicious Act (S.I Cl.1e). FIR mandatory.
THIRD_PARTY_CLAIM_ONLY	TP Property Damage and/or TP Bodily Injury (S.II)
PERSONAL_ACCIDENT	PA Cover — Owner Driver (PA Schedule Cl.1). Check PA add-on for passengers.

4.2 When to assign REQUIRES_VERIFICATION

- DL copy not uploaded and clause requires driver validity.
- FIR copy not uploaded for an incident type where FIR is mandatory.
- Policy was in its waiting period on the incident date.
- Clause text not found in policy_clauses.xlsx for this policy.
- Incident type is OTHER — cannot be mapped to a standard section.
- Multiple policies found for the same vehicle registration.

4.3 Add-on coverage rules — applied automatically

Add-on	Rule
ZERO_DEPRECIATION	If in addon_list: suppress depreciation exclusion. Include ZD clause with status CONDITIONAL.
ENGINE_PROTECTION	If in addon_list: suppress consequential engine damage exclusion for FLOOD incidents.
NCB_PROTECT	If in addon_list: note in triage summary that NCB will not reset on this claim.
INVOICE_COVER	If in addon_list: surface for THEFT_COMPLETE or total loss — insured receives invoice value.

5. How does the copilot identify and present exclusions?

Retrieval process: Filter policy_exclusions.xlsx by policy_id where applicable_incident_types includes the FNOL incident type or equals ALL. Check reinstatement_addon — if the add-on is in the policy's addon_list, skip the exclusion. Check trigger_field and trigger_condition — if met, set confidence to confidence_if_triggered. Never declare an exclusion Confirmed. Always REQUIRES_VERIFICATION. Present in display_order.

5.1 Critical exclusions — check for every incident type

Exclusion code	Trigger condition	Confidence
NO_VALID_DL	DL copy not uploaded	LOW
DRIVING_UNDER_INFLUENCE	FIR or incident description mentions alcohol or drugs	MODERATE
CONSEQUENTIAL_LOSS	Always flagged — watch for rental or loss-of-use claims	HIGH
USE_BEYOND_LIMITATIONS	Incident description suggests commercial use	MODERATE
WAR_NUCLEAR	Incident context suggests war or nuclear event	HIGH

5.2 Add-on-dependent exclusions — check addon_list first

Exclusion code	Rule
DEPRECIATION_CONSUMABLES	If ZERO_DEPRECIATION in addon_list: skip. If not: flag — Confidence HIGH.
TYRES_TUBES	If TYRES_COVER (IMT.23) in addon_list: skip. If not: flag if tyres are only damage.
CONSEQUENTIAL_ENGINE_DAMAGE	FLOOD incidents only. If ENGINE_PROTECTION in addon_list: skip. If not: flag — Confidence HIGH.

6. How does the copilot calculate and present the waiting period?

Mandatory section in every triage summary. Show calculation transparently.

Step	Calculation
1. Get waiting period	Read waiting_period_days from policy_register.xlsx (standard: 30 days).
2. Days since inception	days_since_inception = incident_date – policy_inception_date (in days).
3. Check active	If days_since_inception < waiting_period_days → waiting_period_active = TRUE.
4. Check pre-inception	If incident_date < policy_inception_date → incident_pre_inception = TRUE. Critical exception.

Required output when waiting period is ACTIVE
Policy inception: [date] Waiting period: [N] days Incident date: [date]
Days since inception: [N] days
Conclusion: WAITING PERIOD ACTIVE — incident occurred within the mandatory waiting period.
Confidence: HIGH Escalation triggered: INCIDENT_IN_WAITING_PERIOD
Action: Do not communicate any coverage finding. Senior claims manager review mandatory.

When waiting period is NOT active: 'Waiting period has elapsed — policy has been in force for [N] days. Confidence: HIGH.'

7. How does the copilot retrieve and present claims history?

What to retrieve	How
36-month claim count	Filter claims_history.xlsx by vehicle_reg where claim_date is within 36 months of incident_date. Count all rows.
12-month cross-policy count	Filter claims_history.xlsx by member_id where claim_date is within 12 months. Count across all vehicles.
Last claim date	Maximum claim_date from the 36-month filtered set.
NCB cross-check	If ncb_percent > 0% in policy_register but a recent claim shows ncb_impact = TRUE: flag as NCB discrepancy.

Presentation rules

- Present as factual observations — never as fraud indicators.
- Repeat claimant ($\text{prior_claims_12m} \geq 3$): 'This member has filed [N] claims across all policies in the preceding 12 months. Threshold: 3 or more. This is a data observation — not a fraud determination.'
- Back-to-back ($\text{days_since_last_claim} \leq 30$): 'A prior claim was filed [N] days before the current incident date. This is a data observation — not a fraud determination.'
- If claims_history.xlsx is unreadable: 'Claims history data is unavailable. Do not assume a clean claims record. Verify manually before proceeding.'

8. How does the copilot generate the document gap checklist?

Load document_matrix.json for the FNOL incident type. Compare against uploaded documents in the current session. Classify each document as below.

Status	Meaning	Display
RECEIVED	Uploaded in this session.	Green
MISSING — MANDATORY	Required. Claim can proceed but document must be collected.	Amber
MISSING — CRITICAL / BLOCKING	Absence prevents coverage determination. Claim must not progress.	Red
RECOMMENDED — NOT RECEIVED	Not mandatory but recommended.	Grey

Critical document flag: When any BLOCKING document is missing, raise a prominent notice stating: (1) the document name, (2) why it is blocking — the specific clause it affects, (3) 'This flag does not constitute a coverage denial. It is a data gap that must be resolved by the adjuster.'

Document requirements by incident type

Incident type	Critical / blocking	Mandatory
ACCIDENT_OWEN	RC copy, Vehicle Damage Photo Log	DL copy, Repair estimate
ACCIDENT_WITH_THIRD_PARTY	FIR, RC, DL, Vehicle Damage Photo Log	Repair estimate, TP vehicle RC and DL
ACCIDENT_WITH_THIRD_PARTY_INJURY	FIR, RC, DL, Vehicle Damage Photo Log	Repair estimate, TP medical report, TP vehicle RC and DL
THEFT_COMPLETE	FIR, RC, Key surrender, NOC from financier (if hypothecated)	DL copy
THEFT_PARTIAL	FIR, RC	DL, Repair estimate
FIRE	FIR, RC, Vehicle Damage Photo Log	DL, Repair estimate
FLOOD_OR_NATURAL_Calamity	RC, Vehicle Damage Photo Log	DL, Repair estimate
VANDALISM	FIR, RC, Vehicle Damage Photo Log	DL, Repair estimate
THIRD_PARTY_CLAIM_ONLY	FIR	TP vehicle RC and DL
PERSONAL_ACCIDENT	Medical report, DL	RC copy

9. When does the copilot trigger escalation and what are the 10 conditions?

IMPORTANT — Escalation is set by Python conditional logic. The AI agent cannot override or suppress an escalation flag.

Condition code	Trigger logic	Adjuster instruction
HIGH_VALUE_CLAIM	IDV > Rs.5,00,000 AND incident type is THEFT_COMPLETE, ACCIDENT_WITH_THIRD_PARTY_INJURY, or FIRE	Refer to senior before proceeding.
THIRD_PARTY_BODILY_INJURY	tp_injury_reported = TRUE on FNOL form	Refer to senior. Legal exposure.
THEFT_WITH_ACTIVE_LOAN	incident_type = THEFT_COMPLETE AND hypothecated = TRUE	Financer notification + NOC required. Refer to senior.
INCIDENT_IN_WAITING_PERIOD	days_since_inception < waiting_period_days	Do not communicate coverage finding. Senior review mandatory.
BACK_TO_BACK_CLAIMS	days_since_last_claim ≤ 30	Senior review required.
LATE_FNOL_OVER_7_DAYS	FNOL received more than 7 days after incident date	Request written explanation from claimant. Refer to senior.
LEGAL_NOTICE_OR_TRIBUNAL	legal_notice_present = TRUE on FNOL form	Immediate hold. No claimant contact without legal approval.
INCIDENT_BEFORE_POLICY_START	incident_date < policy_inception_date	Critical exception. Immediate hold.
POLICY_NOT_FOUND	No active policy found for vehicle registration in policy_register.xlsx	Immediate hold. All coverage sections unavailable.
REPEAT_CLAIMANT	prior_claims_12m ≥ 3	Surface to senior for awareness. Does not block triage independently.

Escalation notice — format when any condition is triggered

ESCALATION FLAG — Senior Claims Manager Review Required

This claim has triggered: [condition label(s)]

Triage determination must not be communicated to the claimant until the senior claims manager has reviewed and instructed.

Escalation reason logged in fnol_register.xlsx for audit.

10. What is the aging risk indicator and what does each level mean?

Displayed as a colour-coded badge in the triage summary header. Reflects elapsed time since FNOL registration. In the POC, aging does not drive queue sorting — it is an information indicator only. **Regulatory basis:** IRDAI Motor Claims Settlement Guidelines require acknowledgement within 24 hours of FNOL receipt.

Risk	FNOL age	Colour	Adjuster action
LOW	Under 6 hours	Green	Routine. Review in normal course.
MEDIUM	6 to 18 hours	Amber	Approaching 24-hour IRDAI SLA. Complete triage within 2 hours.
HIGH	18 to 24 hours	Orange	SLA at risk. Complete triage immediately.
CRITICAL	Over 24 hours	Red	IRDAI SLA breached. Escalate to supervisor. Record reason for delay.

11. How must the copilot answer adjuster questions?

- Answer only from text retrieved from Pinecone-indexed documents. Never use general insurance knowledge.
- Always state the source document and section in every response.
- If answer is not found: 'I cannot find a specific guideline for this. Please refer to the full SOP (FNOL-SOP-001) or consult your supervisor.'
- Never include coverage determinations, triage recommendations, or claim approval language.
- Confidence on every Q&A; response: HIGH (clear retrieval match), MODERATE (partial match), LOW (weak match — recommend manual verification).

Write-request refusal — use this exact response

Standard refusal for any write, approve, or action request
'I can read and analyse policy and claims data, but I am not able to update, add, or delete any records.'
'All data modifications must be made directly in the source file by an authorised administrator.'
'I can help you analyse [the relevant topic] if you would like to ask a question about it.'

12. Mandatory phrase reference — exact wording for every standard situation

The copilot must use these phrases exactly. Deviation is not permitted.

Situation	Required phrase
Coverage: applicable, HIGH confidence	'Coverage is applicable under [Section X, Clause Y] — Confidence: HIGH. Adjuster to confirm.'
Coverage: not applicable	'Coverage does not appear applicable based on [Section X, Clause Y] — Confidence: HIGH. Adjuster to determine.'
Coverage: blocked by missing document	'Coverage applicability under [Section X, Clause Y] cannot be confirmed without [document name] — Confidence: MODERATE. Adjuster to request and verify.'
Coverage: clause not found	'This provision is not present in the available policy data — Confidence: LOW. Please verify directly with the full policy schedule.'
Claims history: unavailable	'Claims history data is unavailable. Do not assume a clean record. Please verify manually.'
Exclusion: may apply	'Exclusion [Clause X.X] may apply to this incident — Confidence: [level]. Adjuster to determine applicability.'
Waiting period: active	'The policy was in its mandatory waiting period of [N] days on the incident date. Days since inception: [N]. This claim may not be admissible. Senior claims manager review required.'
Q&A;: answer not found	'I cannot find a specific guideline for this. Please refer to the full SOP or consult your supervisor.'
Write request refused	'I can read and analyse data, but I am not able to update, add, or delete any records. All data modifications must be made directly in the source file by an authorised administrator.'

FNOL-GUIDE-001 • v1.1 Addendum • June 2026

Section 13 — Fraud Signal Indicators (New)

FOR ADJUSTER REVIEW ONLY — informs SIU referral decisions. Not a determination of fraud.

13. What are fraud signal indicators and how do they differ from escalation conditions?

Fraud signal indicators are a separate, additional analysis layer produced by the fraud signal agent, distinct from the 10 sensitive case conditions described in Section 9. Escalation conditions answer ‘does this claim need senior operational review before proceeding?’ Fraud signal indicators answer a narrower question: ‘does this claim show patterns that warrant SIU (Special Investigation Unit) attention?’

The two systems are connected but not identical. Two of the 10 escalation conditions (BACK_TO_BACK_CLAIMS, REPEAT_CLAIMANT) reuse the same underlying data as two of the fraud signals, but the fraud layer applies its own scoring and thresholds on top. A HIGH fraud signal band also adds one additional escalation condition (ELEVATED_REVIEW_INDICATORS) — see Section 13.4.

The AI copilot never asserts that a claim is fraudulent. It surfaces data-grounded indicators for the adjuster and, where warranted, SIU to assess. See the mandatory phrase reference in Section 13.5.

13.2 The fraud signal catalog

Each indicator is either MAJOR (3 points) or MINOR (1 point), and is either a deterministic Python check (structured data comparison) or an LLM-judged check (free-text consistency). Deterministic checks are used wherever the underlying values are categorical, numeric, or already computed elsewhere in the triage pipeline. LLM judgment is used only where the check requires assessing whether free text is internally consistent.

Indicator	Weight	Type	Data source
Back-to-back claims	Major (3)	Deterministic	claims_history (reused from Section 7)
Repeat claimant	Minor (1)	Deterministic	claims_history (reused from Section 7)
Bind-and-grind (claim shortly after inception)	Major (3)	Deterministic	waiting_period (reused from Section 6) + policy register
NCB discrepancy	Minor (1)	Deterministic	claims_history (reused from Section 7)
Hypothecation inconsistency	Minor (1)	Deterministic	RC extraction vs. policy register
Driving licence class mismatch	Major (3)	Deterministic	DL extraction vs. incident vehicle class
Registered owner mismatch	Major (3)	Deterministic	RC owner (PII store) vs. claimant identity (PII store only — never sent to any AI model)
Late reporting	Minor (1)	Deterministic	FNOL received date vs. incident date
Cross-document field mismatch	Minor (1)	Deterministic	existing consistency_checks (from intake agent)
Narrative coherence	Major (3)	LLM-judged	FNOL / FIR free-text narrative
Key status concern (theft claims only)	Minor (1)	LLM-judged	FNOL free-text narrative — applies only when incident_type = THEFT_COMPLETE
Damage-severity plausibility	Minor (1)	LLM-judged	damage description + photo log notes

13.3 How is the fraud score and band calculated?

The fraud score is the sum of points from all triggered indicators (major = 3, minor = 1). The score maps to one of three bands:

Band	Score range	Adjuster action
LOW	0 – 2	No action required beyond standard triage.
MEDIUM	3 – 5	Review the indicator list before proceeding. Does not independently escalate.
HIGH	6 or more	Refer to SIU for review. Also adds the ELEVATED_REVIEW_INDICATORS escalation condition automatically (Section 13.4).

Presentation rule: the fraud section of the triage summary states, ‘[N] of 12 elevated-review indicators are present — Confidence: [level]. Adjuster to assess.’ It never states that a claim is fraudulent, suspicious, or should be denied.

13.4 Relationship to the 10 escalation conditions

IMPORTANT — Escalation is set by Python conditional logic, consistent with the rule stated in Section 9. The AI agent cannot override or suppress an escalation flag.

Condition code	Trigger logic	Adjuster instruction
ELEVATED_REVIEW_INDICATORS	fraud_signals.band = HIGH (score ≥ 6)	Refer to SIU for review. Does not by itself constitute a fraud finding.

This condition is evaluated after the fraud signal agent runs and before the final escalation summary is compiled, so it appears alongside the other 10 conditions in Section 9 wherever escalation is triggered. MEDIUM and LOW fraud bands never trigger escalation on their own.

13.5 What language must the copilot use for fraud-related questions — and avoid?

Same rule as Section 3.1: the copilot must never imply a fraud determination. Use the substitutions below exactly.

Never say	Always say instead
‘This is fraud.’ / ‘This claim is fraudulent.’	‘[N] of 12 elevated-review indicators are present — Confidence: [level]. Adjuster to assess.’
‘The claimant is lying.’	‘The narrative shows an internal inconsistency relative to [specific data point] — Confidence: [level]. Adjuster to verify.’
‘Refer this to the police / deny this claim.’	‘Recommend referral to SIU for further review. Adjuster to determine next steps.’
Any answer that decodes, defines, or explains how to avoid triggering a specific fraud indicator.	‘I can describe what indicators exist in general terms, but I cannot advise on how to avoid detection. Please consult your SIU liaison for that.’

13.6 Confidentiality — who may see fraud signal detail

Per Section 1, the FNOL Assistance Streamlit UI is operated by the adjuster throughout — registration, triage review, and FNOL query — not by the claimant directly. Fraud signal detail (score, band, per-indicator breakdown, and the plain-language summary) is therefore shown consistently across all adjuster-facing surfaces:

the FNOL registration confirmation screen, the Query FNOL screen, and the full triage summary (PDF and JSON).

This mirrors the existing rule in Section 3.3 restricting personal information from the triage panel — the restriction there is about protecting claimant PII from any AI system, not about withholding fraud signal detail from the adjuster. The adjuster is the intended recipient of fraud signal detail at every stage.

13.7 How must the copilot answer adjuster Q&A about fraud signals?

- Answer only from the retrieved context in this addendum and the triage summary for the specific FNOL under discussion — never from general fraud-investigation knowledge.
- If asked which specific wording or pattern triggers an indicator (e.g. ‘what exact phrasing counts as a narrative inconsistency?’), decline and redirect: this level of detail is not shared, to preserve the indicator’s effectiveness.
- If asked for an FNOL-specific fraud score without an FNOL reference number provided, ask the adjuster to look up the specific FNOL via the Query FNOL screen — the RAG panel does not have live access to any specific claim’s fraud_signals output.
- Never speculate about whether a specific claimant is committing fraud, even if the adjuster asks directly. Redirect to the documented indicator list and confidence levels.
- Confidence on every fraud-related Q&A response follows the same HIGH / MODERATE / LOW rule as Section 2.
